12	ACTH	3 mL K2- and K3-EDTA Only use pre-cooled sampling vials. After drawing the blood, put the vials immediately on ice. Use a cooled centrifuge to separate the plasma. Measure samples immediately or freeze them at -20 °C (± 5° C). Stable for 2 hours at 22 °C, 4 weeks at -20. °C (± 5° C). Freeze only once. 1 ml EDTA plasma (send frozen), ACTH is very unstable; subsequent freezing in the laboratory is not possible; blood collection should be done in the morning due to fluctuations of the ACTH level during the day. During longer sample transport, the EDTA plasma should arrive frozen in the laboratory.	9 HRS / Same Day	Rs. 4,100/-

481	<b>Serum Haptoglobin</b>	3 ml SST/Gel 3 ml Serum	7 Days / 22:00	<b>Rs. 1,800/-</b>
482	<b>Serum Homocysteine</b>	3ml SST/Gel Blood should be taken fasting, as methionine in the food leads to an increase in homocysteine concentration. Homocysteine is continuously produced in the erythrocytes even after blood collection and released into the serum/plasma. For this reason, the homocysteine level in non-centrifuged or non-inhibited whole blood continuously increases artificially by approx. 10 % per hour. Compliance with the preanalytics described below is therefore imperative! We recommend serum as the primary material since haemolysis or artificially increased homocysteine measurements due to the presence of erythrocytes are excluded. The blood must be centrifuged as soon as possible after collection and within one hour at the latest. After centrifugation, transfer the serum into a neutral sample tube. Storage and transport of the serum should be refrigerated.	2 Days / 22:00	<b>Rs. 2,520/-</b>
